Knowledge of 12 principles of animation

Lab 10 : Greensock - drawSVG, splitText, motion along a path, GSAP licensing

I like the combination of this animation movement, because it combines many skills together such as drawing with svg combined with using javascript, motion along path, ... to create an animation, animation has many objects combined together, it creates a lively, soft animation scene, viewers will feel more interesting because it shows more realistic varieties. For example, the combination of airplanes, airplanes, a draggable tool, controlled flying aircraft as our request, this will help us make small games, ... Using drawing images with svg creates an object, and it has a lot of support for programming for object to work, I like this aspect very much. If we learn more about this aspect we will create a perfect animation, and impressive.
